

TOPOLOGICAL SPACES

ARTHUR RYMAN

ABSTRACT. This article contains Z Notation definitions for topological spaces and related concepts. It has been type checked by *f*UZZ.

CONTENTS

1. TOPOLOGICAL SPACES

1.1. *Topology*. A *topology* τ on X is a family of subsets of X , referred to as the *open* subsets of X , that satisfy the following axioms.

$Topology[X]$	_____
$\tau : \mathcal{F} X$	
$\emptyset \in \tau$	
$X \in \tau$	
$\forall F : \mathbb{F} \tau \bullet \bigcap F \in \tau$	
$\forall F : \mathbb{P} \tau \bullet \bigcup F \in \tau$	

- The empty set is open.
- The whole set is open.
- The intersection of a finite family of open sets is open.
- The union of any family of open sets is open.

1.2. *top and tops*. Let $top[X]$ denote the set of all topologies on X .

$[X]$	=====
$top : \mathbb{P}(\mathcal{F} X)$	
$top = \{ Topology[X] \bullet \tau \}$	

Let $tops[X]$ denote the set of all topologies on subsets $U \subseteq X$.

Date: August 14, 2022.

$[X]$
$tops : \mathbb{P}(\mathcal{F} X)$
$tops = \bigcup \{ U : \mathbb{P} X \bullet top[U] \}$

1.3. *discrete and indiscrete.* The *discrete* topology on X consists of all subsets of X . The *indiscrete* topology on X consists of just X and \emptyset . Let $discrete[X]$ and $indiscrete[X]$ denote the discrete and indiscrete topologies on X .

$[X]$
$discrete, indiscrete : \mathcal{F} X$
$discrete = \mathbb{P} X$
$indiscrete = \{\emptyset, X\}$

Example. Let X be an arbitrary set. Then $discrete[X]$ and $indiscrete[X]$ are topologies on X .

$$discrete[X] \in top[X]$$

$$indiscrete[X] \in top[X]$$

1.4. *topGen.*

Remark. The intersection of a set of topologies on X is also a topology on X .

Given a family B of subsets of X , the topology *generated by* B is the intersection of all topologies that contain B . The set B is referred to as a *basis* for the topology it generates. Let $topGen[X] B$ denote the topology on X generated by the basis B .

$[X]$
$topGen : \mathcal{F} X \rightarrow top[X]$
$\forall B : \mathcal{F} X \bullet$ $topGen B = \bigcap \{ \tau : top[X] \mid B \subseteq \tau \}$

Example. Let X be an arbitrary set.

$$topGen[X] \emptyset = indiscrete[X]$$

$$topGen[X] \{\emptyset\} = indiscrete[X]$$

$$topGen[X] \{X\} = indiscrete[X]$$

1.5. *topSpace.* Let X be a set. A *topological space* is a pair (X, τ) where τ is a topology on X . Let $topSpace[X]$ denote the set of all topological spaces (X, τ) .

$$topSpace[X] == \{ \tau : top[X] \bullet (X, \tau) \}$$

Example. Let X be an arbitrary set.

$$(X, indiscrete[X]) \in topSpace[X]$$

$$(X, discrete[X]) \in topSpace[X]$$

1.6. *topSpaces*. Let $topSpaces[t]$ denote the set of all topological spaces (X, τ) where X is a subset of t .

$[t]$	$topSpaces : \mathbb{P} t \leftrightarrow \mathcal{F} t$
	$topSpaces = \{ X : \mathbb{P} t; \tau : \mathcal{F} t \mid \tau \in top[X] \}$

Remark.

$$topSpace[X] \subseteq topSpaces[X]$$

2. CONTINUOUS MAPPINGS

Let (X, τ) and (Y, σ) be topological spaces.

2.1. *Continuous*. A mapping $f : X \rightarrow Y$ is said to be *continuous* if the inverse image of every open set is open.

$Continuous[X, Y]$	$f : X \rightarrow Y$
	$\tau : top[X]$
	$\sigma : top[Y]$
	$\forall U : \sigma \bullet$
	$f^{-1}(U) \in \tau$

2.2. $C^0 \setminus \mathbf{CzeroTT}$. Let A and B be topological spaces, and let $C^0(A, B)$ denote the set of continuous mappings from A to B .

$[X, Y]$	$C^0 : topSpace[X] \times topSpace[Y] \rightarrow \mathbb{P}(X \rightarrow Y)$
	$\forall \tau : top[X]; \sigma : top[Y] \bullet$
	$\text{let } A == (X, \tau); B == (Y, \sigma) \bullet$
	$C^0(A, B) = \{ f : X \rightarrow Y \mid Continuous[X, Y] \}$

2.3. The Identity Mapping.

Remark. *The identity mapping is continuous.*

$$\begin{aligned} & \forall \tau : top[X] \bullet \\ & \quad \text{let } A == (X, \tau) \bullet \\ & \quad \quad id_X \in C^0(A, A) \end{aligned}$$

Remark. *The constant mapping is continuous.*

$$\begin{aligned} & \forall \tau : top[X]; \sigma : top[Y]; c : Y \bullet \\ & \quad \text{let } A == (X, \tau); B == (Y, \sigma) \bullet \\ & \quad \quad const[X, Y]c \in C^0(A, B) \end{aligned}$$

2.4. Composition of Continuous Mapping.

Remark. Let X , Y , and Z be arbitrary sets. The composition of continuous mappings is a continuous mapping.

$$\begin{aligned} \forall A : \text{topSpace}[X]; B : \text{topSpace}[Y]; C : \text{topSpace}[Z] \bullet \\ \forall f : C^0(A, B); g : C^0(B, C) \bullet \\ g \circ f \in C^0(A, C) \end{aligned}$$

3. INDUCED TOPOLOGY

Let $A = (X, \tau)$ be a topological space and let $U \subseteq X$ be a subset. The topology on X induces a topology on U . This topology is variously referred to as the *induced*, *relative*, or *subspace* topology on U .

3.1. $|\mathcal{F}| \backslash \text{inducedFam}$. Let ϕ be a family of subsets of X and let U be a subset of X . The family of subsets of U induced by ϕ is the set of intersections of the members of ϕ with U . Let $\phi|_{\mathcal{F}} U$ denote the family on U induced by ϕ .

$\begin{aligned} & \text{---}[X] \text{---} \\ & - _{\mathcal{F}} - : \mathcal{F} X \times \mathbb{P} X \rightarrow \mathcal{F} X \\ & \forall \phi : \mathcal{F} X; U : \mathbb{P} X \bullet \\ & \quad \phi _{\mathcal{F}} U = \{ Y : \phi \bullet Y \cap U \} \end{aligned}$

Remark. If τ is a topology on X then $\tau|_{\mathcal{F}} U$ is a topology on U .

$$\begin{aligned} \forall \tau : \text{top}[X]; U : \mathbb{P} X \bullet \\ \tau|_{\mathcal{F}} U \in \text{top}[U] \end{aligned}$$

3.2. $|\text{top}| \backslash \text{inducedTopSp}$. Let $(X, \tau)|_{\text{top}} U$ denote the corresponding induced topological space.

$\begin{aligned} & \text{---}[X] \text{---} \\ & - _{\text{top}} - : \text{topSpace}[X] \times \mathbb{P} X \rightarrow \text{topSpaces}[X] \\ & \forall \tau : \text{top}[X]; U : \mathbb{P} X \bullet \\ & \quad (X, \tau) _{\text{top}} U = (U, \tau _{\mathcal{F}} U) \end{aligned}$
--

4. PRODUCT TOPOLOGY

Let (X, τ) and (Y, σ) be topological spaces. There is a natural topology on $X \times Y$ generated by the products of the sets in τ and σ .

4.1. $\times_{\mathcal{F}} \backslash \text{prodFam}$. Let X and Y be sets and let ϕ and ψ be families on them. The product of these families is the family that consists of the products of the sets in them and is a family on $X \times Y$. Let $\phi \times_{\mathcal{F}} \psi$ denote the product of the families.

$\begin{aligned} & \text{---}[X, Y] \text{---} \\ & -\times_{\mathcal{F}} - : \mathcal{F} X \times \mathcal{F} Y \rightarrow \mathcal{F}(X \times Y) \\ & \forall \phi : \mathcal{F} X; \psi : \mathcal{F} Y \bullet \\ & \quad \phi \times_{\mathcal{F}} \psi = \{ U : \phi; V : \psi \bullet U \times V \} \end{aligned}$

Remark. If τ and σ are topologies then $\tau \times_{\mathcal{F}} \sigma$ is not, in general, a topology. However, we can use it to generate a topology.

4.2. $\times_{\text{top}} \backslash \text{prodTop}$. Let $\tau \times_{\text{top}} \sigma$ denote the topology generated by $\tau \times_{\mathcal{F}} \sigma$.

$[X, Y]$
$- \times_{\text{top}} - : \text{top}[X] \times \text{top}[Y] \rightarrow \text{top}[X \times Y]$
$\forall \tau : \text{top}[X]; \sigma : \text{top}[Y] \bullet$ $\tau \times_{\text{top}} \sigma = \text{topGen}(\tau \times_{\mathcal{F}} \sigma)$

4.3. $\times_{\text{top}} \backslash \text{prodTopSp}$. Let $(X, \tau) \times_{\text{top}} (Y, \sigma)$ denote the product topological space.

$[X, Y]$
$- \times_{\text{top}} - : \text{topSpace}[X] \times \text{topSpace}[Y] \rightarrow \text{topSpace}[X \times Y]$
$\forall \tau : \text{top}[X]; \sigma : \text{top}[Y] \bullet$ $(X, \tau) \times_{\text{top}} (Y, \sigma) = (X \times Y, \tau \times_{\text{top}} \sigma)$
