1. Introduction

Groups are ubiquitous in mathematics and physics. This article formalizes groups and related group-like algebraic structures using Z Notation[1]. It has been type checked by fUZZ[2].

2. Group-Like Algebraic Structures

In general, an *algebraic structure* consists of one or more sets of elements equipped with one or more objects, such as operations, defined on them. A group is an algebraic structure equipped with one binary operation, typically referred to as its *product* or *group law*.

Magmas, semigroups, monoids, and abelian groups are algebraic structures that are like groups but differ from them in terms of the properties imposed on their product operation.

Date: February 17, 2025.

- 2.1. **Genericity.** In general, the definition of a structure does not depend on the concrete types of its underlying sets of elements. Instead, the definition of a structure is usually given in terms of one or more *generic parameters* that represent arbitrary given sets. We use symbols like t, u, and v as generic parameters in definitions. We use symbols like T, U, and V as arbitrary sets in propositions.
- 2.2. **Partial Binary Operations.** A partial binary operation on a set of elements t is a partial function from pairs of elements to elements.

Define PBINOP[t] to be the set of all partial binary operations on t.

$$PBINOP[t] == t \times t \rightarrow t$$

Here I am using the convention of defining names consisting of all uppercase letters for sets that are declared as type abbreviations to the fUZZ type checker.

Example (Integer Division and Modulus). Integer division and modulus are partial binary operations on \mathbb{Z} .

$$(_\operatorname{div}_) \in PBINOP[\mathbb{Z}]$$

 $(_\operatorname{mod}_) \in PBINOP[\mathbb{Z}]$

2.3. **Total Binary Operations.** A *total binary operation*, or simply a *binary operation*, is a partial binary operation defined on every pair of elements.

Define binop[t] to be the set of all binary operations on t.

$$\mathit{binop}[t] == t \times t \longrightarrow t$$

Remark. Every binary operation is a partial binary operation.

$$binop[T] \subseteq PBINOP[T]$$

Example (Integer Addition, Subtraction, and Multiplication). Integer addition, subtraction, and multiplication are binary operations on \mathbb{Z} .

```
(-+-) \in binop[\mathbb{Z}]

(---) \in binop[\mathbb{Z}]

(-*-) \in binop[\mathbb{Z}]
```

Example (Integer Division and Modulus). *Integer division and modulus by* 0 *is undefined.*

$$\forall n : \mathbb{Z} \bullet (n,0) \notin \operatorname{dom}(_\operatorname{div}_)$$
$$\forall n : \mathbb{Z} \bullet (n,0) \notin \operatorname{dom}(_\operatorname{mod}_)$$

Therefore, integer division and modulus are not total binary operations on Z.

$$(_\operatorname{div}_) \notin binop[\mathbb{Z}]$$

 $(_\operatorname{mod}_) \notin binop[\mathbb{Z}]$

2.4. **Carriers.** The main underlying set of an algebraic structure is sometimes referred to as its *carrier*. When writing informal mathematics, it is normally unnecessary to distinguish between a structure and its carrier since the intended meaning is usually clear from context. For example, consider the following statement:

Let G be a group and let g be an element of G.

Here the first instance of G stands for the structure while the second stands for its carrier.

However, a set of elements may have more than one structure in a given context. For example, the set of integers has both additive and multiplicative structures. In such cases it may be ambiguous if only the carrier is specified. Furthermore, if the mathematics is expressed using a formal language such as Z Notation, distinct mathematical objects must be referred to using distinct names or expressions.

In order to distinguish between structures and their carriers, this article adopts the common mathematical practice of defining structures as *tuples* consisting of a carrier together with one or more additional objects such as operations or distinguished elements.

When introducing variables to refer to structures and their carriers, we'll use some typographical convention such as bold font to relate the two. For example, the structure \mathbf{A} has carrier A.

Let A be a subset of t. We say that a structure A with carrier A is a structure in t. If A coincides with t we say that A is a structure on t. Note that a structure on t is also a structure in t.

3. Magmas

3.1. **Magmas.** A magma is a set A equipped with a total binary operation, generically referred to as a product. Let $x \cdot y$ denote the product of x and y. Regarded as a structure **A**, a magma is a pair $(A, (_\cdot _))$.

Define MAGMA[t] to be the type abbreviation for a magma structure.

 $MAGMA[t] == Pt \times PBINOP[t]$

```
Magma[t] \_\_
A : \mathbb{P} t
\_ \cdot \_ : PBINOP[t]
A : MAGMA[t]
(\_ \cdot \_) \in binop[A]
A = (A, (\_ \cdot \_))
```

- The product is a binary operation on A.
- The structure is the pair consisting of the carrier and the binary operation.

Define magma[t] to be the set of all magmas in t.

```
magma[t] == \{ Magma[t] \bullet A \}
```

Remark. Every magma in t has type MAGMA[t].

$$magma[T] \subseteq MAGMA[T]$$

Define $magma_on(A)$ to be the set of all magmas on A.

$$magma_on[t] == (\lambda A : \mathbb{P} t \bullet \{A\} \lhd magma[t])$$

Remark. $magma_on(A)$ is a subset of magma[t].

$$\forall A : \mathbb{P} \mathsf{T} \bullet magma_on(A) \subseteq magma[\mathsf{T}]$$

Remark. Every magma is a magma on its carrier.

$$\forall Magma[T] \bullet A \in magma_on(A)$$

Example (Integer Addition). Define int_add to be the set of integers equipped with addition.

$$int_add == (\mathbb{Z}, (_+_))$$

Integer addition is a magma on \mathbb{Z} .

$$int_add \in magma_on(\mathbb{Z})$$

Example (Integer Subtraction). Define int_sub to be the set of integers equipped with subtraction.

$$int_sub == (\mathbb{Z}, (_-_))$$

Integer subtraction is a magma on \mathbb{Z} .

$$int_sub \in magma_on(\mathbb{Z})$$

Example (Integer Multiplication). Define int_mul to be the set of integers equipped with multiplication.

$$int_mul == (\mathbb{Z}, (_*_))$$

Integer multiplication is a magma on \mathbb{Z} .

$$int_mul \in magma_on(\mathbb{Z})$$

3.2. Maps and Homomorphisms. A magma map from A to A' is a map of their carriers. We refer to A as the domain of the map and A' as its codomain. Alternatively, we refer to A as the source of the map and A' its target.

Just as magmas are structures, so also are magma maps. Recall that we may informally use the same name, say A, to refer to both a magma and its carrier. Similarly, we may informally use the same name, say f, to refer to both a magma map structure and its underlying map of the carriers. When we need to distinguish between the structure and its underlying map, we'll use some typographic convention to relate the two. For example, we may use F for the structure and f for its underlying map. That being said, the formal text will always use distinct names in any given context.

Define $MAGMA_MAP[t,u]$ to be the type abbreviation for the set of all maps from magmas in t to magmas in u.

```
\mathit{MAGMA\_MAP}[\mathsf{t},\mathsf{u}] == (\mathit{MAGMA}[\mathsf{t}] \times \mathit{MAGMA}[\mathsf{u}]) \times (\mathsf{t} \to \mathsf{u})
```

```
egin{align*} Magma\_Map[\mathsf{t},\mathsf{u}] & & & & & & \\ Magma[\mathsf{t}] & & & & & & \\ Magma'[\mathsf{u}] & & & & & & \\ f:\mathsf{t} & \mapsto \mathsf{u} & & & & & \\ F:MAGMA\_MAP[\mathsf{t},\mathsf{u}] & & & & & \\ f & \in A & \mapsto A' & & & & \\ F & = (\mathbf{A},\mathbf{A}') & \mapsto f & & & & \\ \end{array}
```

- f maps A to A'
- ullet A magma map structure F consists of a pair of magmas and a map f between their carriers.

Define $magma_Map[t, u]$ to be the set of all magma maps from magmas in t to magmas in u.

```
magma\_Map[t, u] == \{ Magma\_Map[t, u] \bullet F \}
```

Define $magma_map(\mathbf{A}, \mathbf{A}')$ to be the subset of magma maps from \mathbf{A} to \mathbf{A}' .

```
\begin{aligned} magma\_map[\mathsf{t},\mathsf{u}] &== \\ (\lambda \, \mathbf{A} : magma[\mathsf{t}]; \, \mathbf{A}' : magma[\mathsf{u}] \bullet \\ \{(\mathbf{A}, \mathbf{A}')\} \lhd magma\_Map[\mathsf{t}, \mathsf{u}]) \end{aligned}
```

Remark. $magma_map(\mathbf{A}, \mathbf{A}')$ is a subset of $magma_Map[\mathsf{t}, \mathsf{u}]$.

```
\forall \mathbf{A} : magma[\mathsf{T}]; \mathbf{A}' : magma[\mathsf{U}] \bullet 

magma\_map(\mathbf{A}, \mathbf{A}') \subseteq magma\_Map[\mathsf{T}, \mathsf{U}]
```

A magma homomorphism is magma map that preserves products.

• f preserves the product operation

Define $magma_Hom[t,u]$ to be the set of all magma homomorphisms from magmas in t to magmas in u.

```
magma\_Hom[t, u] == \{ Magma\_Hom[t, u] \bullet F \}
```

Define $magma_hom(\mathbf{A}, \mathbf{A}')$ to be the subset of magma homomorphisms from \mathbf{A} to \mathbf{A}' .

```
\begin{aligned} magma\_hom[\mathsf{t},\mathsf{u}] &== \\ (\lambda \, \mathbf{A} : magma[\mathsf{t}]; \, \mathbf{A}' : magma[\mathsf{u}] \bullet \\ \{(\mathbf{A},\mathbf{A}')\} \lhd magma\_Hom[\mathsf{t},\mathsf{u}]) \end{aligned}
```

Remark. $magma_hom(\mathbf{A}, \mathbf{A}')$ is a subset of $magma_Hom[t, u]$.

```
\forall \mathbf{A} : magma[\mathsf{T}]; \mathbf{A}' : magma[\mathsf{U}] \bullet 

magma\_hom(\mathbf{A}, \mathbf{A}') \subseteq magma\_Hom[\mathsf{T}, \mathsf{U}]
```

Example (Multiplication by a Fixed Integer). Consider multiplication by a fixed integer c.

```
 \begin{array}{c} MulConst \\ Magma\_Map[\mathbb{Z}, \mathbb{Z}] \\ c: \mathbb{Z} \\ \hline \\ \mathbf{A} = \mathbf{A}' = int\_add \\ f = (\lambda \, x: \mathbb{Z} \bullet c * x) \end{array}
```

Define $mul_const(c)$ to be the corresponding magma map.

```
mul\_const == \{ MulConst \bullet c \mapsto F \}
```

The magma map $mul_const(c)$ sends \mathbb{Z} to \mathbb{Z} and preserves addition. Therefore this map is a magma homomorphism.

```
\forall c : \mathbb{Z} \bullet \\ mul\_const(c) \in magma\_hom(int\_add, int\_add)
```

Proof.

$$\forall c, x, y : \mathbb{Z} \bullet$$
$$c * (x + y) = c * x + c * y$$

Example (Exponentiation by a Fixed Natural Number). Consider exponentiation by a fixed natural number n.

```
ExpConst \_
Magma\_Map[\mathbb{Z}, \mathbb{Z}]
n : \mathbb{N}
\mathbf{A} = \mathbf{A}' = int\_mul
f = (\lambda x : \mathbb{Z} \bullet x ** n)
```

Define $exp_const(n)$ to be the corresponding magma map.

$$exp_const == \{ ExpConst \bullet n \mapsto F \}$$

The magma map $exp_const(n)$ sends \mathbb{Z} to \mathbb{Z} and preserves multiplication. Therefore this map is a magma homomorphism.

```
\forall ExpConst \bullet \\ exp\_const(n) \in magma\_hom(int\_mul, int\_mul)
```

Proof.

$$\forall\, n: \mathbb{N};\, x,y: \mathbb{Z} \bullet \\ (x*y)**n = x**n*y**n$$

3.3. **Identity Maps.** Consider the identity map from the carrier of a magma to itself.

```
Magma\_Id[t]
Magma\_Map[t, t]
A = A'
f = id A
```

- the identity magma map sends a magma to itself
- the underlying map of carriers is the identity map

Define $magma_id(\mathbf{A})$ to be the magma identity map of \mathbf{A} . $magma_id[\mathbf{t}] == \{ Magma_Id[\mathbf{t}] \bullet \mathbf{A} \mapsto F \}$

Remark.

$$magma_id[T] \in MAGMA[T] \longrightarrow MAGMA_MAP[T, T]$$

Remark. The identity map is a homomorphism.

$$\forall \mathbf{A} : magma[\mathsf{T}] \bullet \\ magma_id(\mathbf{A}) \in magma_hom(\mathbf{A}, \mathbf{A})$$

3.4. **Composition.** Let f be a homomorphism from A to A' and let f' be a homomorphism from A' to A''. The function composition $g = f' \circ f$ is a map from A to A''.

```
\begin{array}{c} \textit{Magma\_Composition}[\mathsf{t},\mathsf{u},\mathsf{v}] \\ \textit{Magma\_Hom}[\mathsf{t},\mathsf{u}] \\ \textit{Magma\_Hom'}[\mathsf{u},\mathsf{v}] \\ \textit{g}:\mathsf{t} \to \mathsf{v} \\ \textit{G}:\textit{magma\_Map}[\mathsf{t},\mathsf{v}] \\ \\ \textit{g} = f' \circ f \\ \\ \textit{G} = (\mathbf{A},\mathbf{A}'') \mapsto \textit{g} \end{array}
```

Remark. The composition of two magma homomorphisms is a magma homomorphism.

```
\forall Magma\_Composition[\mathsf{T},\mathsf{U},\mathsf{V}] \bullet G \in magma\_hom(\mathbf{A},\mathbf{A}'')
```

Let $G = F' \circ F$ denote the composition of magma homomorphisms.

$$(_ \circ _)[\mathsf{t}, \mathsf{u}, \mathsf{v}] == \{ \mathit{Magma_Composition}[\mathsf{t}, \mathsf{u}, \mathsf{v}] \bullet (F', F) \mapsto G \}$$

Remark. The identity map is a left and right identity element with respect to composition.

```
\forall Magma\_Hom[\mathsf{T},\mathsf{U}] \bullet \\ magma\_id(\mathbf{A}') \circ F = F = F \circ magma\_id(\mathbf{A})
```

3.5. Subsets and Submagmas.

3.5.1. Subsets. Consider a subset S of the elements A of magma **A**. Let **S** be the structure that consists of the pair (\mathbf{A}, S) .

Define $MAGMA_SUBSET[t]$ to be the type abbreviation for magma subset structures in t.

$$MAGMA_SUBSET[t] = MAGMA[t] \times \mathbb{P} t$$

```
\begin{array}{c} \textit{Magma\_Subset}[t] \\ \textit{Magma}[t] \\ \textit{S} : \mathbb{P} \, \mathbf{t} \\ \mathbf{S} : \textit{MAGMA\_SUBSET}[t] \\ \hline \\ \textit{S} \subseteq \textit{A} \\ \mathbf{S} = (\mathbf{A}, \textit{S}) \end{array}
```

Define $magma_Subset[t]$ to be the set of all subset structures in t. $magma_Subset[t] == \{ Magma_Subset[t] \bullet S \}$

Define $magma_subset(\mathbf{A})$ to be the set of all subset structures of \mathbf{A} . $magma_subset[\mathbf{t}] == (\lambda \mathbf{A} : magma[\mathbf{t}] \bullet \{\mathbf{A}\} \lhd magma_Subset[\mathbf{t}])$

Example. The natural numbers are a subset of the integers.

 $\mathbb{N} \subset \mathbb{Z}$

 $(int_add, \mathbb{N}) \in magma_subset(int_add)$ $(int_mul, \mathbb{N}) \in magma_subset(int_mul)$

3.5.2. Intersection. Given two subsets S_1, S_2 of magma \mathbf{A} , their intersection S is a subset of A. The intersection of two subset structures is therefore another subset structure.

Intersection is therefore a partial binary operation on the set of subsets of magmas. Let $S = S_1 \cap S_2$ denote the intersection of magma subsets.

```
(\_ \cap \_)[t] == \{ Magma\_Intersection[t] \bullet (S_1, S_2) \mapsto S \}
```

Remark. The intersection of subsets of A is a subset of A.

```
\forall \mathbf{A} : magma[\mathsf{T}] \bullet

\forall \mathbf{S}_1, \mathbf{S}_2 : magma\_subset(\mathbf{A}) \bullet

\mathbf{S}_1 \cap \mathbf{S}_2 \in magma\_subset(\mathbf{A})
```

3.5.3. Submagma. A submagma is a subset that is closed under products.

```
 \begin{array}{c} Magma\_Submagma[t] \_\_\\ Magma\_Subset[t] \\ \hline \\ \forall x,y:S \bullet x \cdot y \in S \end{array}
```

Define $magma_Submagma[t]$ to be the set of all submagma structures in t. $magma_Submagma[t] == \{ Magma_Submagma[t] \bullet \mathbf{S} \}$

Remark. Every submagma structure is a subset structure. $magma_Submagma[T] \subseteq magma_Subset[T]$

Define $magma_submagma(\mathbf{A})$ to be the set of all submagmas of \mathbf{A} . $magma_submagma[t] == (\lambda \mathbf{A} : magma[t] \bullet \{\mathbf{A}\} \triangleleft magma_Submagma[t])$

Example. Natural numbers are closed under the operations of addition and multiplication.

```
(int\_add, \mathbb{N}) \in magma\_submagma(int\_add)
(int\_mul, \mathbb{N}) \in magma\_submagma(int\_mul)
```

Remark. The intersection of submagmas of A is a submagma of A.

 $\forall Magma_Intersection[T] \bullet S \in magma_submagma(A)$

3.5.4. Restriction. A submagma S of ${\bf A}$ defines a magma ${\bf A}'$ by restricting the product to S.

```
 \begin{array}{c} Magma\_Restriction[t] \\ Magma\_Submagma[t] \\ Magma'[t] \\ \hline A' = S \\ \forall \, x,y:A' \bullet x \cdot' \, y = x \cdot y \end{array}
```

Define $magma_Restriction[t]$ to be the set of all restrictions of submagmas in t. $magma_Restriction[t] == \{ Magma_Restriction[t] \bullet S \mapsto A' \}$

Define $magma_restriction(\mathbf{A})$ to be the set of all restrictions of submagmas of \mathbf{A} $magma_restriction[t] == (\lambda \mathbf{A} : magma[t] \bullet$ $magma_submagma(\mathbf{A}) \lhd magma_Restriction[t])$

Remark. Restriction is a function from submagmas of **A** to magmas.

```
\forall \mathbf{A} : magma[\mathsf{T}] \bullet \\ magma\_restriction(\mathbf{A}) \in magma\_submagma(\mathbf{A}) \longrightarrow magma[\mathsf{T}]
```

3.6. **Images.** The *image* of a magma map is the subset of the target magma that consists of the image under the map of the elements in the source magma.

Remark. The image of a magma homomorphism is a submagma of its target.

```
\forall Magma\_Image[\mathsf{T},\mathsf{U}] \mid \\ Magma\_Hom[\mathsf{T},\mathsf{U}] \bullet \\ Magma\_Submagma'[\mathsf{U}]
```

Proof. It suffices to show that the product of any two elements x', y' in the image S' is also in S'. By definition of the image, there exists elements x and y in A such that x' = f(x) and y' = f(y). Therefore $x' \cdot y' = f(x) \cdot f(y) = f(x \cdot y)$ which is clearly in the image of f.

Define $magma_image$ to be the function that sends a magma map to its image. $magma_image[t, u] == \{ Magma_Image[t, u] \bullet F \mapsto \mathbf{S}' \}$

Consider the restriction of the image of a magma homomorphism.

```
Magma_Im[t, u]

Magma_Image[t, u]

Magma_Hom[t, u]

Magma_Restriction'[u]
```

Define $magma_im$ to be the function that sends a magma homomorphism to the restriction of its image.

```
magma\_im[t, u] == \{ Magma\_Im[t, u] \bullet F \mapsto A'' \}
```

4. Semigroups

4.1. **Associativity.** A magma is said to be *associative* if the result of applying its operation to any three elements is independent of the order in which it is applied pairwise.

```
Associative[t] \\ Magma[t] \\ \forall x, y, z : A \bullet \\ x \cdot y \cdot z = x \cdot (y \cdot z)
```

4.2. **Semigroups.** An associative magma is called a *semigroup*.

```
Semigroup[t]
Associative[t]
```

Let semigroup[t] denote the set of all semigroups in t.

```
semigroup[t] == \{ Semigroup[t] \bullet A \}
```

Remark. Every semigroup is a magma.

```
semigroup[T] \subseteq magma[T]
```

Example (Sequence Concatenation). Finite sequences in t with the operation of concatenation form a semigroup since concatenation is associative.

 $\forall SequenceConcat[T] \bullet A \in semigroup[seq T]$

4.3. **Homomorphisms.** A *semigroup homomorphism* is a homomorphism of the underlying magmas.

```
Semigroup\_Hom[t, u]
Magma\_Hom[t, u]
\mathbf{A} \in semigroup[t]
\mathbf{A}' \in semigroup[u]
```

- A is a semigroup in t
- A' is a semigroup in u

Let $semigroup_Hom[t,u]$ be the set of all homomorphisms from semigroups in t to semigroups in u.

```
semigroup\_Hom[t, u] == \{ Semigroup\_Hom[t, u] \bullet F \}
```

Let $semigroup_hom(\mathbf{A}, \mathbf{A}')$ be the subset of semigroup homomorphisms from \mathbf{A} to \mathbf{A}' .

```
\begin{aligned} semigroup\_hom[t, u] &== \\ (\lambda \, \mathbf{A} : semigroup[t]; \, \mathbf{A}' : semigroup[u] \bullet \\ \big\{ \, (\mathbf{A}, \mathbf{A}') \, \big\} \lhd semigroup\_Hom[t, u] \big) \end{aligned}
```

Remark. The identity mapping of a semigroup to itself is a semigroup homomorphism.

```
\forall Magma\_Id[T] \bullet
\mathbf{A} \in semigroup[T] \Rightarrow
Semigroup\_Hom[T, T]
```

Remark. Every magma homomorphism of semigroups is a semigroup homomorphism.

```
\forall Magma\_Hom[\mathsf{T},\mathsf{U}] \bullet

\mathbf{A} \in semigroup[\mathsf{T}] \land \mathbf{A}' \in semigroup[\mathsf{U}] \Rightarrow

F \in semigroup\_hom(\mathbf{A},\mathbf{A}')
```

Remark. If F is magma homomorphism from A to A' and A is a semigroup then the image of F is a semigroup.

```
\forall Magma\_Hom[\mathsf{T},\mathsf{U}] \bullet \\ \mathbf{A} \in semigroup[\mathsf{T}] \Rightarrow magma\_im(F) \in semigroup[\mathsf{U}]
```

4.4. Composition. Consider the composition of semigroup homomorphisms.

 ${\bf Remark.}\ \, {\it The\,\, composition\,\, of\,\, semigroup\,\, homomorphisms\,\, is\,\, a\,\, semigroup\,\, homomorphism.}$

```
\forall Semigroup\_Composition[\mathsf{T},\mathsf{U},\mathsf{V}] \bullet G \in semigroup\_hom(\mathbf{A},\mathbf{A}'')
```

5. Monoids

5.1. **Identity Elements.** Let \mathbf{A} be a magma and let e be an element of A. The element e is said to be an *identity element* of \mathbf{A} if left and right products with it leave all elements unchanged.

Clearly, not all magmas have identity elements. For example, consider the set of even integers under multiplication. However, if a magma has an identity element, then it is unique. This will be proved next.

Let $identity_element$ denote the relation between magmas and their identity elements.

```
\begin{aligned} identity\_element[t] == \\ \{ \ IdentityElement[t] \bullet \mathbf{A} \mapsto e \ \} \end{aligned}
```

Remark.

```
identity\_element[\mathsf{T}] \in magma[\mathsf{T}] \longleftrightarrow \mathsf{T}
```

Consider the case of a magma **A** that has, possibly distinct, identity elements e, e'.

Remark. If a magma has an identity element then it is unique.

```
\forall IdentityElements[T] \bullet
e = e'

Proof.

e
= e \cdot e'
= e'

[e' \text{ is an identity element}]
= e'

[e \text{ is an identity element}]
```

Remark. The preceding remark shows that if an identity element exists then it is unique. This means that the relation from magmas to identity elements is a partial function.

```
identity\_element[T] \in magma[T] \longrightarrow T
```

Identity elements are typically denoted by the symbol 0 when the operation is thought of as an addition or the symbol 1 when the operation is thought of as a multiplication.

5.2. **Monoids.** A *monoid* in t is a semigroup in t that has an identity element.

```
Monoid[t] \\ Semigroup[t] \\ IdentityElement[t]
```

Let monoid[t] be the set of all monoids in t.

$$monoid[t] == \{ \, Monoid[t] \bullet \mathbf{A} \, \}$$

Remark. Given a monoid we can recover its identity element by applying the identity_element function to it.

$$identity_element[\mathsf{T}] \in monoid[\mathsf{T}] \longrightarrow \mathsf{T}$$

5.3. **Homomorphisms.** Let \mathbf{A} and \mathbf{A}' be monoids and let f map the elements of A to the elements of A'. The map f is said to preserve identity elements if it maps the identity element of \mathbf{A} to the identity element of \mathbf{A}' .

A monoid homomorphism is a homomorphism of the underlying semigroups that preserves identity.

```
\_Monoid\_Hom[t, u]
\_Semigroup\_Hom[t, u]
MapPreservesIdentity[t, u]
```

Let $monoid_Hom[t,u]$ be the set of all homomorphisms from monoids in t to monoids in u.

```
monoid\_Hom[t, u] == \{ Monoid\_Hom[t, u] \bullet F \}
```

Let $monoid_hom(\mathbf{A}, \mathbf{A}')$ denote the set of all monoid homomorphisms from \mathbf{A} to \mathbf{A}' .

```
monoid\_hom[t, u] ==
(\lambda \mathbf{A} : monoid[t]; \mathbf{A}' : monoid[u] \bullet
\{ (\mathbf{A}, \mathbf{A}') \} \lhd monoid\_Hom[t, u] )
```

Remark. The identity mapping is a monoid homomorphism.

Remark. The composition of two monoid homomorphisms is another monoid homomorphism.

6. Groups

6.1. **Inverse Operations.** Let A be a magma that has an identity element. A unary operation inv on A is said to be an inverse operation if it maps each element to an element whose product with it is the identity element.

Let *inverse_operation* denote the relation between magmas and their inverse operations.

```
inverse\_operation[t] == \{InverseOperation[t] \bullet \mathbf{A} \mapsto inv \}
```

Remark. If a monoid has an inverse operation then it is unique.

 $\forall InverseOperations[T] \bullet inv = inv'$

Proof. Suppose inv and inv' are inverse operations. Let x be any element.

inv'x

Remark. Since inverse operations are unique if exist they, the relation between monoids and inverse operations is a partial function.

```
inverse\_operation[T] \in monoid[T] \longrightarrow T \longrightarrow T
```

6.2. **Groups.** A group is a monoid that has an inverse operation.

Let group[t] be the set of all groups in t.

```
group[t] == \{ Group[t] \bullet A \}
```

6.3. **Homomorphisms.** Let **A** and **A'** be groups and let F be a monoid homomorphism. The map f is said to *preserve inverses* if it maps the inverses to the inverses. A group homomorphism is a monoid homomorphism that preserves inverses.

```
Group\_Hom[t, u] = \\ Monoid\_Hom[t, u] \\ Group[t] \\ Group'[u] 
\forall x : A \bullet f(inv x) = inv'(f x)
```

Let group_Hom[t, u] be the set of all group homomorphisms.

```
group\_Hom[t, u] == \{ Group\_Hom[t, u] \bullet F \}
```

Let $group_hom(\mathbf{A}, \mathbf{A}')$ denote the set of all group homomorphisms from \mathbf{A} to \mathbf{A}' .

$$\begin{aligned} \textit{group_hom}[\mathsf{t},\mathsf{u}] &== \\ (\lambda \, \mathbf{A} : \textit{group}[\mathsf{t}]; \, \mathbf{A}' : \textit{group}[\mathsf{u}] \bullet \\ \{ \, (\mathbf{A},\mathbf{A}') \, \} \lhd \textit{group_Hom}[\mathsf{t},\mathsf{u}]) \end{aligned}$$

Example (Identity). The identity mapping is a group homomorphism.

 $\forall Magma_Id[T] \bullet F \in group_hom(\mathbf{A}, \mathbf{A})$

6.4. Composition. Consider the composition of two group homomorphisms.

```
Group_Composition[t, u, v]

Magma_Composition[t, u, v]

Group_Hom[t, u]

Group_Hom'[u, v]
```

Remark. The composition of two group homomorphisms is another group homomorphism.

 $\forall \ Group_Composition[\mathsf{T},\mathsf{U},\mathsf{V}] \bullet \ G \in group_Hom[\mathsf{T},\mathsf{V}]$

6.5. **Bijections.** Let bij[t] denote the set of all bijections from t to itself.

$$bij[t] == t \rightarrow\!\!\! t$$

Let Bij[t] be the structure whose carrier is bij[t] and whose product is composition.

$$Bij[t] == (bij[t], (\lambda f, g : bij[t] \bullet g \circ f))$$

Remark. The composition of bijections is a bijection.

$$\forall f, g : bij[\mathsf{T}] \bullet \\ f \circ g \in bij[\mathsf{T}]$$

Since bijections are closed under composition, Bij[t] is a magma.

 $Bij[\mathsf{T}] \in magma[bij[\mathsf{T}]]$

Remark. Composition is associative.

$$\forall f, g, h : bij[\mathsf{T}] \bullet f \circ (g \circ h) = (f \circ g) \circ h$$

Since composition is associative, Bij[t] is a semigroup.

 $Bij[\mathsf{T}] \in semigroup[bij[\mathsf{T}]]$

Remark. The identity function idt is an identity element for Bij[t].

$$\forall f : bij[\mathsf{T}] \bullet \\ id \mathsf{T} \circ f = f = f \circ id \mathsf{T}$$

Since Bij[t] has an identity element, it is a monoid.

 $Bij[\mathsf{T}] \in monoid[bij[\mathsf{T}]]$

Remark. The relational inverse f^{\sim} of a bijection f is its inverse under composition.

```
\forall f : bij[\mathsf{T}] \bullet f \circ f^{\sim} = \operatorname{id} \mathsf{T} = f^{\sim} \circ f
```

Since Bij[t] has an inverse operation, it is a group.

 $Bij[T] \in group[bij[T]]$

6.6. **Subgroups.** A subgroup A of a group A' is a nonempty subset that is closed under the group product and inverse operation.

```
Subgroup[t]
A: \mathbb{P}_1 t
Group'[t]
A \subseteq A'
\forall x, y: A \bullet x \cdot' y \in A
\forall x: A \bullet inv'(x) \in A
```

- the subgroup is a subset of the group
- the subgroup is closed under products
- the subgroup is closed under inverses

Remark. A subgroup contains the group identity element.

 $\forall Subgroup[T] \bullet identity_element(A') \in A$

Proof. By definition, the subgroup A is nonempty. Let $x \in A$. Therefore $inv'(x) \in A$ since the subgroup is closed under inverses. Therefore $x \cdot 'inv'(x) \in A$ since the subgroup is closed under product. But $x \cdot 'inv'(x) = e$ the identity element of A'. Therefore $e \in A$.

A subgroup inherits a group structure from its enclosing group.

```
Subgroup\_Group[t] \\ Subgroup[t] \\ Magma[t] \\ e:t \\ inv:t \mapsto t \\ \hline (\_\cdot\_) = (\lambda \, x, y: A \bullet x \cdot 'y) \\ e = e' \\ inv = (\lambda \, x: A \bullet inv'(x))
```

- the subgroup product is the restriction of the group product
- the subgroup identity element is the group identity element

• the subgroup inverse operation is the restriction of the group inverse operation

Remark. A subgroup is a group.

```
\forall Subgroup\_Group[T] \bullet Group[T]
```

There is a natural inclusion map from the subgroup to the group.

```
Subgroup\_Inclusion[t]
Subgroup\_Group[t]
Magma\_Map[t,t]
f = id A
```

• the map is the inclusion of the subgroup into the group

Remark. The subgroup inclusion map is a group homomorphism.

```
\forall Subgroup\_Inclusion[T] \bullet Group\_Hom[T, T]
```

7. Abelian Groups

7.1. **Commutativity.** A magma **A** in t is said to be *commutative* when the product of two elements doesn't depend on their order.

```
Commutative[t] \\ \hline Magma[t] \\ \hline \forall x, y : A \bullet x \cdot y = y \cdot x
```

7.2. **Abelian Groups.** An *abelian group* is a group in which the product is commutative.

```
AbelianGroup[t] Group[t] Commutative[t]
```

Let abgroup[t] denote the set of all abelian groups in t.

```
abgroup[t] == \{ AbelianGroup[t] \bullet A \}
```

Often in an abelian group the binary operation is denoted as addition x + y, the identity element as a zero 0, and the inverse operation as negation - x.

Example (Integer Addition). Addition over the integers is an abelian group.

$$(\mathbb{Z}, (\underline{} + \underline{})) \in abgroup[\mathbb{Z}]$$

REFERENCES 19

7.3. **Homomorphisms.** A homomorphism of abelian groups is a homomorphism of the underlying groups.

```
AbelianGroup_Hom[t, u] ______

Group_Hom[t, u] _____

Group[t] _____

Group'[u]
```

Let $abgroup_Hom[t,u]$ be the set of all abelian group homomorphisms from abelian groups in t to abelian groups in u.

```
abgroup\_Hom[t, u] == \{ AbelianGroup\_Hom[t, u] \bullet F \}
```

Let $abgroup_hom(\mathbf{A}, \mathbf{A}')$ be the subset of abelian group homomorphisms from \mathbf{A} to \mathbf{A}' .

```
\begin{array}{l} abgroup\_hom[\mathsf{t},\mathsf{u}] == \\ (\lambda\,\mathbf{A}: abgroup[\mathsf{t}];\,\mathbf{A}': abgroup[\mathsf{u}] \bullet \\ \{\,(\mathbf{A},\mathbf{A}')\,\} \vartriangleleft abgroup\_Hom[\mathsf{t},\mathsf{u}]) \end{array}
```
